

Product Information

acentec is the direct sales and support partner for software developer MedInformatix's fully integrated EMR and Practice Management Solution. The system is designed for an enterprise wide-area networked environment. We implement a totally paper/filmless office by allowing patient records to be accessed at the actual point-of-care via a wireless pen tablet or stationary PC and by managing all clinical, administrative and follow-up processes electronically.

- ✓ Our EMR streamlines and digitizes all aspects of the documentation of patient care. Our Practice Management System integrates with EMR seamlessly and electronically facilitates the use of that data with the requirements of billing, collections, claims, scheduling, reports, lab results, imaging, referrals and other clinical and practice procedures.
- ✓ The system is easy to use, designed with the intuitive workflow of a medical practice in mind, and requires minimal clicks to reach vital screens for faster operation, data entry and retrieval.
- ✓ The system architecture is scalable, adaptable; Windows and wireless technology based and supports standard interfaces making it a solid foundation for any size or type of application.
- ✓ Although it has been designed as an integrated system - linking all the functions of front office, back office, collections and billing - each module can also stand alone. This allows clients greater flexibility and choice.
- ✓ The unique software design allows us to easily build out the system for specific operational needs.
- ✓ The software is compliant with industry standards and protocols (e.g. HIPAA) and is constantly being upgraded with new features that allow greater functionality and more streamlined workflow.
- ✓ Professional installation, training and available 24/7 support with online interactive troubleshooting capability in real time provide superior service and worry-free operation.

Software – Excellence by Design

What makes the MedInformatix system so unique and highly adaptable is its revolutionary design. The program was one of the first developed using a 4 tiered architecture. As depicted in the image below, there is a foundational structure that forms the core of the system, yet many of the procedures, workflows and decision flows are not fixed routines. This allows us to customize certain processes according to the client's needs, operational requirements or the needs of a particular medical specialty.

We can do so without changing the integrity of the structure or having to reprogram the system from the ground up. Today the program has evolved utilizing the most current programming languages, including C#, .NET, and XML.

The design of the Interface is also exceptional from a presentation, capability and ergonomics standpoint. Our screens are viewer friendly, with tab-based forms and minimal number of click-throughs to key functions, resulting in a dramatic increase in user speed.

Our software has won numerous awards as a result of its exceptional design, functionality, performance and user acclaim. We are proud of the value we have added to our clients by providing them with a comprehensive and robust software solution.
